

OM UJAR POLISH

Operations Guide

Setup, daily use, and troubleshooting for the polishing system.

CONTENTS

- 1** First-Time Setup (New Mac)
- 2** iPhone Certificate Setup
- 3** Starting the App Every Day
- 4** Using the App
- 5** Phone Scanner
- 6** Troubleshooting

SECTION 1

First-Time Setup (New Mac)

Do this once when setting up on a new computer. You need an internet connection for this step.

1 Copy the project folder

Copy the entire project folder (the one containing setup.sh) to the new Mac. Desktop or Documents works fine.

2 Open Terminal

Press Cmd + Space, type Terminal, and press Enter. A text window opens.

3 Run the setup script

In Terminal, type the following and press Enter:

```
cd /path/to/project-folder  
bash setup.sh
```

Tip: drag the project folder into the Terminal window to auto-fill the path.

Your Mac password may be asked once during certificate installation — this is expected and safe.

4 Note your URLs

After setup finishes, two URLs are printed:

```
App URL:    https://Your-Mac-Name.local:3001  
Scanner URL: https://Your-Mac-Name.local:3001/scan.html
```

Write these down. You will use them every day.

5 Open the app launcher

Double-click Polish System.app in the project folder.

If macOS asks "Are you sure?", click Open.

From now on, just double-click this app to start the system.

SECTION 2

iPhone Certificate Setup

Do this once per iPhone. This lets the phone trust the secure connection to the app.

1 Find the certificate file on the Mac

Open Terminal and run:

```
open "$(mkcert -CAROOT)"
```

A Finder window opens with a file called rootCA.pem inside.

2 AirDrop the file to iPhone

Right-click rootCA.pem !' Share !' AirDrop.

Select the iPhone from the list.

On the iPhone, tap Allow.

3 Install the profile

1. Open Settings on the iPhone
2. At the top, tap Profile Downloaded
3. Tap Install (top right corner)
4. Enter your iPhone passcode if prompted
5. Tap Install again, then Done

4 Enable full trust

1. Go to Settings !' General !' About
2. Scroll to the very bottom !' tap Certificate Trust Settings
3. Find mkcert in the list
4. Toggle it ON (turns green)
5. Tap Continue on the warning

You only need to do this once per iPhone. Changing WiFi networks does not affect the certificate trust — the phone stays trusted.

SECTION 3

Starting the App Every Day

This is all you need to do each morning.

1 Connect both devices to WiFi

Make sure both the Mac and iPhone are on the same WiFi network.

2 Launch the app

Double-click Polish System.app in the project folder.

Wait about 5 seconds — the browser opens automatically.

If the browser shows "Your connection is not private": click Advanced !' Proceed to site. This only appears the first time on a new browser, not every day.

SECTION 4

Using the App

Creating a New Job (Incoming Ornament)

- Go to Create Initial Bill
- Select the customer from the dropdown (or create a new one)
- Select the Ornament Type — type to search, e.g. "pa" to find Payal
- If the type is not listed, choose + Other and type the name — it saves for next time
- Place the ornament on the scale — weight appears automatically
- Press Capture Weight (repeat for multiple pieces)
- Review the Bill Summary and click Create Bill
- The receipt prints and a PDF is generated

Completing a Job (Outgoing Ornament)

- Go to Complete Job
- Scan the barcode on the receipt, or type the job number manually
- Enter the outgoing weights (Javak Vajan)
- Enter Bag Vajan (weight of the bag or packaging)
- Enter Ghat if applicable
- Review the Fine calculation and click Complete Job
- The completion receipt prints

Customer Ledger

- Select a customer and month to view all their jobs
- Toggle between Summary (totals) and Detailed (per job) view
- Download as CSV or PDF

Daily Ledger

- Select a date range to view all completed jobs for that period
- Toggle columns on or off as needed
- Download as CSV or PDF

Monthly Archive

- Select the month — usually done on the 5th or 6th of the following month
- Click Load Preview to review what will be archived
- Click Download Archive — saves an Excel file per customer

SECTION 5

Phone Scanner

The phone scanner reads the barcode on a receipt and fills in the job number on the laptop automatically — no typing needed.

Before scanning

- Phone and laptop must be on the same WiFi network
- The Complete Job page must be open on the laptop — the scanner only works when that page is open

1 Open the scanner page on iPhone

In Safari, go to:

`https://Your-Mac-Name.local:3001/scan.html`

Replace Your-Mac-Name with the name from setup. Bookmark this URL so you do not need to type it again.

2 Allow camera access

Tap Allow when Safari asks for camera permission. This is required to scan barcodes.

3 Scan the barcode

Point the camera at the barcode on the receipt.

The job number appears in the Complete Job form on the laptop automatically.

WiFi rule: both phone and laptop must be on the same network. If scanning stops working, check that both devices show the same network name in their WiFi settings.

SECTION 6

Troubleshooting

App does not open / Polish System.app does nothing

Open Terminal and run:

```
cat /tmp/polish-server.log
```

Look for any error at the bottom of the output and share it with your developer.

Browser shows "Your connection is not private"

Click Advanced !' Proceed to localhost (unsafe). Expected the first time on a new browser.

Phone shows certificate error on the scanner page

- Check that you completed all four steps in Section 2 (iPhone Certificate Setup)
- Confirm the Certificate Trust toggle is ON: Settings !' General !' About !' Certificate Trust Settings

Scanner scans but nothing happens on the laptop

- Make sure the Complete Job page is open on the laptop
- Confirm both devices are on the same WiFi network

Scale weight not showing

- Plug in the scale via USB before starting the app
- Restart the app: close Polish System.app, wait 5 seconds, then open it again

Setup script errors on a new Mac

Run this in Terminal first, then try setup.sh again:

```
xcode-select --install
```
